

Saturday Afternoon

summary

Issues that were raised

- Do we use RAMS or consider using RegCM which is already being used in EA

Data sharing and pub

- The need to come up with rules that we all agree upon
- NSF LTER has some policies on this; might consider this as a model (for data)
- Need for a vehicle for publication – one of the easiest solutions is a book

Study Area

- It might need to be expanded from current map because of need of regional climate model to have extended coarse grid
- Might need to model LUCC in Congo and other areas that might experience huge changes in the future

Consultancies

- Idea is that there is some product associated with the payment of the consultancy
- Need to write up a SOW for each person
- Product is generally a written report
 - What has been done and what will be accomplished in the next year

CLIP and GEF

- There is some possibility for additional funding for the study that helps to support EA researchers and some other aspects of the study
- Need to explore other funding sources to help support EA students and faculty and their field research
